Uncertainty

## Motivation: Class room thought experiment

### The human trait

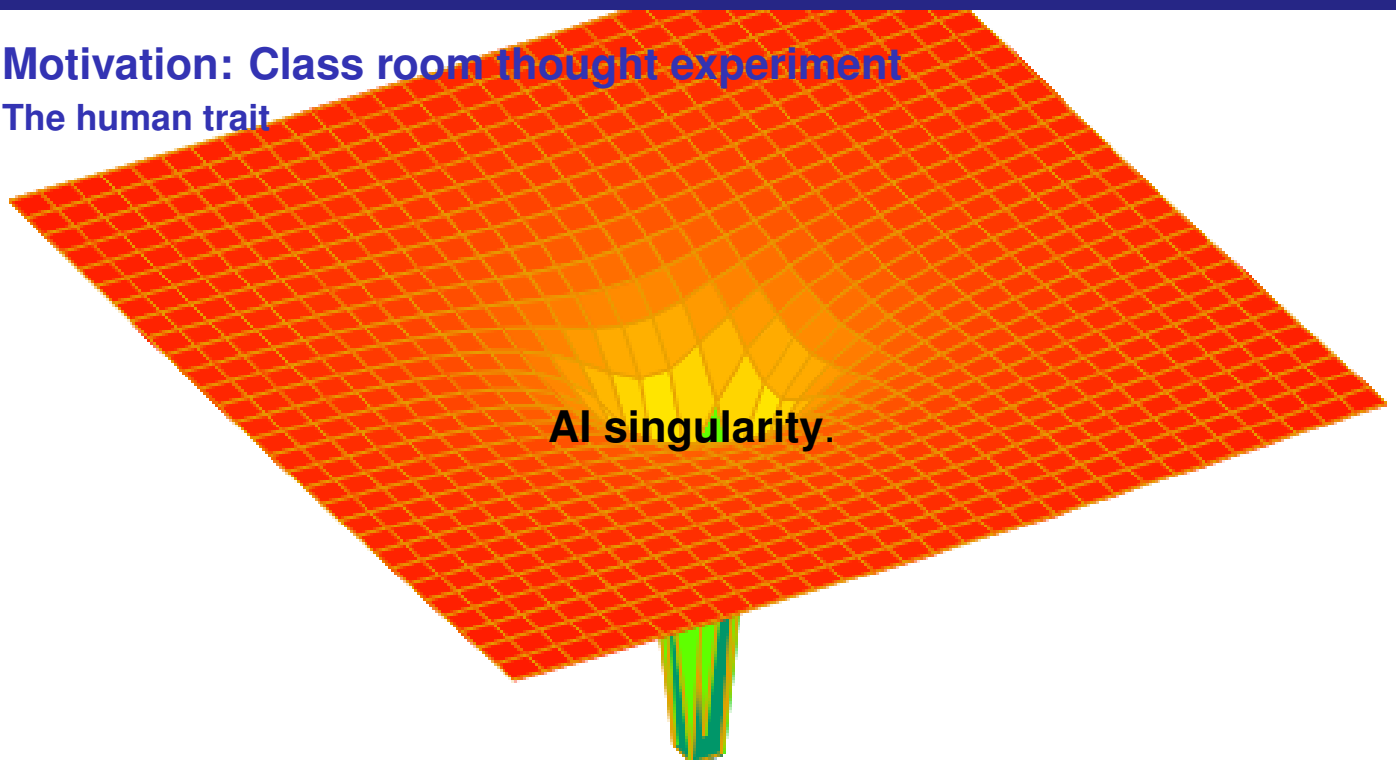

Imagine the moment when you (can) . . .

- ▶ create an artificial copy of a human,
- ▶ in its entirety,
- ▶ with understanding all its internal (causal) dependencies.

Call this moment . . .

## Motivation: Class room thought experiment

### The human trait

## Motivation: Class room thought experiment

### The human trait

However, AI singularity either

- ▶ does not exist, or
- ▶ does not matter.

## Motivation: Class room thought experiment

### The human trait

- ▶ (i) **does not** exist
  - ▶ humans are genuinely individual
  - ▶ human action is genuinely unpredictable
  - ▶ methodological individualism justified
- ▶ (ii) **does** exist
  - ▶ humans are replicable
  - ▶ human action is genuinely predictable
  - ▶ AI singularity may have occurred in the past
    - ▶ we are are replica!
    - ▶ **AI singularity does not matter!**

## Motivation: Class room thought experiment

### The human trait

- ▶ (i) **does not** exist
  - ▶ humans are genuinely individual
  - ▶ human action is genuinely unpredictable
  - ▶ methodological individualism justified
- ▶ (ii) **does** exist
  - ▶ humans are replicable
  - ▶ human action is genuinely predictable
  - ▶ AI singularity may have occurred in the past
    - ▶ we are are replica!
    - ▶ **AI singularity does not matter!**

Therefore, let's assume:

Humans cannot be emulated by humans or by non-humans.

(AI does not exist, thank you!)

## A taxonomy of uncertainty

### Problem statement

- ▶ AI non-singularity gives rise to “uncertainty”: human action is unpredictable.
- ▶ Q: What is uncertainty?
- ▶ A: It is popular.
- ▶ `repec.org` search for “uncertainty”:
  - ▶ 2003 – 12 / 2006: 1'348 (28 per month)
  - ▶ 2007 – 06 / 2010: 1'526 (37 per month)
  - ▶ **+32 percent**

## A taxonomy of uncertainty

### Problem statement

- ▶ AI non-singularity gives rise to “uncertainty”: human action is unpredictable.
- ▶ Q: What is uncertainty?
- ▶ A: It is popular.
- ▶ `repec.org` search for “uncertainty”:
  - ▶ 2003 – 12 / 2006: 1'348 (28 per month)
  - ▶ 2007 – 06 / 2010: 1'526 (37 per month)
  - ▶ **+32 percent**

Ruffino (2014, p. 3) notes “Google searches for the phrase economic ‘uncertainty’, for example, rose to an all-time high in February 2009. The second-highest level was reached in May 2010, as the euro-zone crisis intensified.”

## A taxonomy of uncertainty

### Problem statement

#### What is uncertainty?

- ▶ quantity of usage at odds with quality (and quantity) of definition.
- ▶ most common usage: variance (of something)
- ▶ usage driven by
  - ▶ longing for empirical results,
  - ▶ marketing of publications (financial crisis)
  - ▶ and similar

Proper definitions for scientific use still needed.

## A taxonomy of uncertainty

### Problem statement

Famous definitions of “uncertainty”.

- ▶ Knight (1921)
- ▶ Keynes (1924)
- ▶ Keynes (1936)
- ▶ Ellsberg (1961)

Insightful applications.

- ▶ Keynes (1936)
- ▶ Savage (1951)
- ▶ Muth (1961)
- ▶ Shackle (1972)
- ▶ Minsky (1986)

## A taxonomy of uncertainty

### Problem statement

Making “uncertainty” operational: taxonomy of “uncertainty”

1. determinism
2. randomness
3. ambiguity
4. uncertainty

Principle approach: inference between states of the world.

## A taxonomy of uncertainty

### Definitions

#### Determinism.

- ▶ Determinism is a process that deduces the properties of a final state from the properties of an initial state. The final state is unique.

## A taxonomy of uncertainty

### Definitions

#### Determinism.

- ▶ Determinism is a process that deduces the properties of a final state from the properties of an initial state. The final state is unique.

#### Examples.

- ▶ Water wets a floor
- ▶ dropping a pen
- ▶ roulette
- ▶ complex systems (*inter alia* Sonnenschein 1973, Cass& Shell 1983, Ormerod 1999)

## A taxonomy of uncertainty

### Definitions

#### Risk.

- ▶ Risk is a process that deduces the properties of a final state from the properties of an initial state. The final state is not unique. Each possible final state has a known (simple risk) or knowable (common risk) probability of occurrence.

## A taxonomy of uncertainty

### Definitions

#### Risk.

- ▶ Risk is a process that deduces the properties of a final state from the properties of an initial state. The final state is not unique. Each possible final state has a known (simple risk) or knowable (common risk) probability of occurrence.

#### Examples.

- ▶ quantum leap
- ▶ complex systems when ignoring the inherent determinism
- ▶ ...?

## A taxonomy of uncertainty

### Definitions

#### What if probabilities remain unknown?

*The practical difference between the two categories, risk and uncertainty, is that in the former the distribution of the outcome in a group of instances is known (either through calculation a priori or from statistics of past experience), while in the case of uncertainty this is not true, the reason being in general that it is impossible to form a group of instances, because the situation dealt with is in a high degree unique.*

*Knight (1921, p. 233)*

## A taxonomy of uncertainty

### Definitions

#### Ambiguity.

- ▶ Ambiguity is a process that deduces the properties of a final state from the properties of an initial state. The final state is not unique. Each final state has a probability of occurrence. At least one final state has an unknown probability of occurrence.

#### Example.

- ▶ Ellsberg's urn experiment

## A taxonomy of uncertainty

### Definitions

Determinism, risk and ambiguity: resting on objective laws.  
What if there are now laws?

*By “uncertain” knowledge, let me explain, I do not mean merely to distinguish what is known for certain from what is only probable. The game of roulette is not subject, in this sense, to uncertainty; nor is the prospect of a Victory bond being drawn. Or, again, the expectation of life is only slightly uncertain. Even the weather is only moderately uncertain. The sense in which I am using the term is that in which the prospect of a European war is uncertain, or the price of copper and the rate of interest twenty years hence, or the obsolescence of a new invention, or the position of private wealth-owners in the social system in 1970. About these matters there is no scientific basis on which to form any calculable probability whatever. We simply do not know. Keynes (1937, pp. 213f)*

## A taxonomy of uncertainty

### Definitions

#### Uncertainty.

- ▶ Uncertainty is a process that deduces the properties of a set of final states from the properties of an initial state. The final state is not unique. One or more final states are not known altogether.

#### Examples.

- ▶ the prospect of a European war
- ▶ the price of copper and the rate of interest twenty years hence
- ▶ the obsolescence of a new invention
- ▶ the position of private wealth-owners in the social system in 2070

## A taxonomy of uncertainty

### Definitions

#### Uncertainty.

- ▶ Uncertainty is a process that deduces the properties of a set of final states from the properties of an initial state. The final state is not unique. One or more final states are not known altogether.

#### Examples.

- ▶ the prospect of a European war
- ▶ the price of copper and the rate of interest twenty years hence
- ▶ the obsolescence of a new invention
- ▶ the position of private wealth-owners in the social system in 2070

#### We simply do not know.

#### There is no AI singularity.

# A taxonomy of uncertainty

Uncertainty

# Uncertainty and rationality

## Rationality

- ▶ There is no AI singularity ✓
- ▶ There is a limit to knowledge ✓
- ▶ **So what??**

## Uncertainty and rationality

### Rationality

Uncertainty affects several key economic concepts

- ▶ decision making
- ▶ economic policy
- ▶ economics' ontology
- ▶ methodology
- ▶ rationality

## Uncertainty and rationality

### Rationality

Are people “rational”?

*Rational people systematically and purposefully do the best they can to achieve their objectives, given the available opportunities.*

*Mankiw: Principles of Macroeconomics 6th ed.*

## Uncertainty and rationality

### Rationality

Are people “rational”?

*Rational people systematically and purposefully do the best they can to achieve their objectives, given the available opportunities.*

*Mankiw: Principles of Macroeconomics 6th ed.*

... a “useless” definition unless ...

## Uncertainty and rationality

### Rationality

Are people “rational”?

*Rational people systematically and purposefully do the best they can to achieve their objectives, given the available opportunities.*

*Mankiw: Principles of Macroeconomics 6th ed.*

... one knows “the best”.

## Uncertainty and rationality

### Rationality

Are people “rational”?

- ▶ “rational” people act “rationally”
- ▶ comparison of actual to theoretically “best” decision
- ▶ investigator has to know “the best”

## Uncertainty and rationality

### Rationality

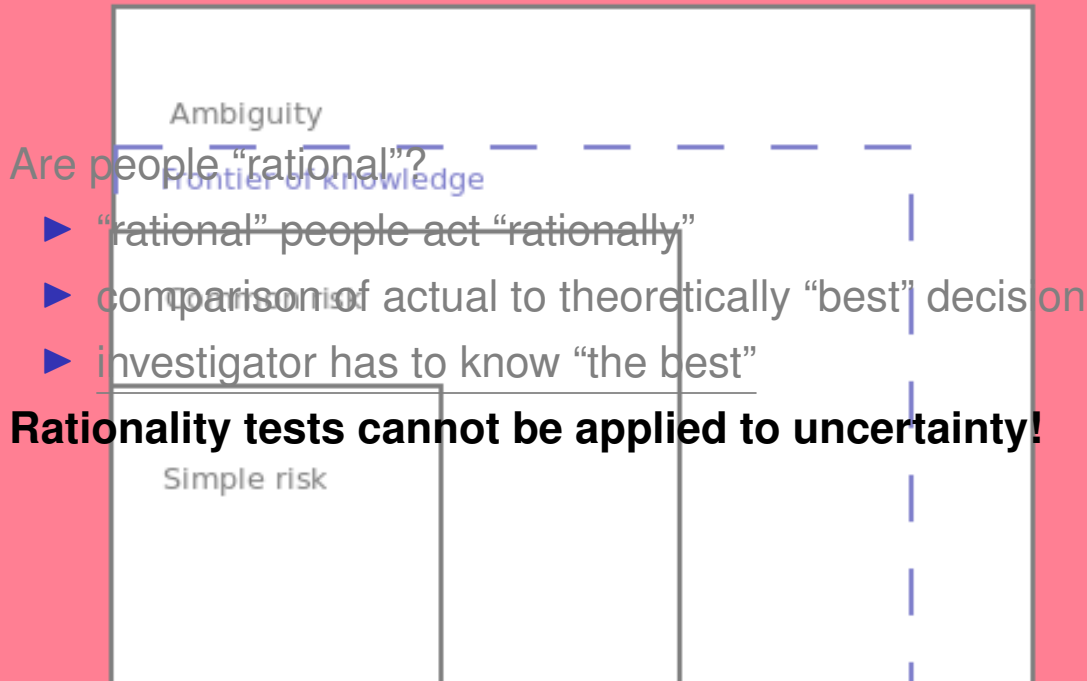

Are people “rational”?

- ▶ “rational” people act “rationally”
- ▶ comparison of actual to theoretically “best” decision
- ▶ investigator has to know “the best”

**Rationality tests cannot be applied to uncertainty!**

## Uncertainty and rationality

### Rationality

## Uncertainty and puzzles

### Puzzles

Puzzles arise when rationality tests fail.

#### Examples

- ▶ uncovered interest parity puzzles
- ▶ forward rate puzzle
- ▶ (exchange rate) volatility puzzle
- ▶ gone–fishing–effect
- ▶ ... (e.g. Meese & Rogoff, 1983; Obstfeld & Rogoff, 2000)

## Uncertainty and puzzles

### Puzzles

Puzzles demand “explain(away)tions” (Thaler).

- ▶ sample effects: wrong country, wrong period, wrong assets, wrong...
- ▶ too small confident bands, woodoo statistics
- ▶ *[...] Lothian (2016) [...] recently wrote a paper [...] using 100 to 200 years [...] for about 20 rich countries, he found good but still noisy evidence that UIP held. [...] Lothian notes that 2/3 of the beta coefficients (which should equal exactly 1 in theory) have values of between 0.75 and 1.25. But since we can still “fail to reject” the hypothesis that beta equals 1, Lothian treats this as pro-UIP long run evidence. [...]*

*I think Lothian’s approach is the right one, and [...] most readers would come to Lothian’s conclusion: That it’s nice that “in the extremely long run” UIP holds on average, but it’s still a puzzle why it often fails to hold in the short run.*

## Uncertainty and puzzles

## Uncertainty and puzzles

### Puzzles

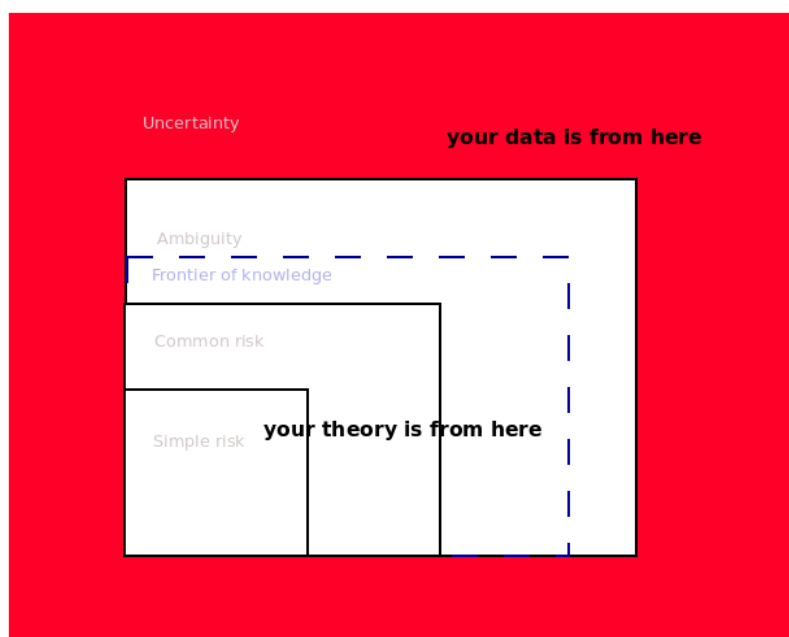

#### (De) constructing puzzles I

1. have a theory (ideally from “first principles”)
2. ignore uncertainty
3. turn your theory into an objective truth (Savage + Muth)
4. take your theory to the data
5. reject your theory
6. **declare the rejection a “puzzle”** ✓
7. “explainaway” the rejection and maintain your theory
8. take more / other data, go to 4 (and continue publishing about puzzles)

## Uncertainty and puzzles

### Puzzles

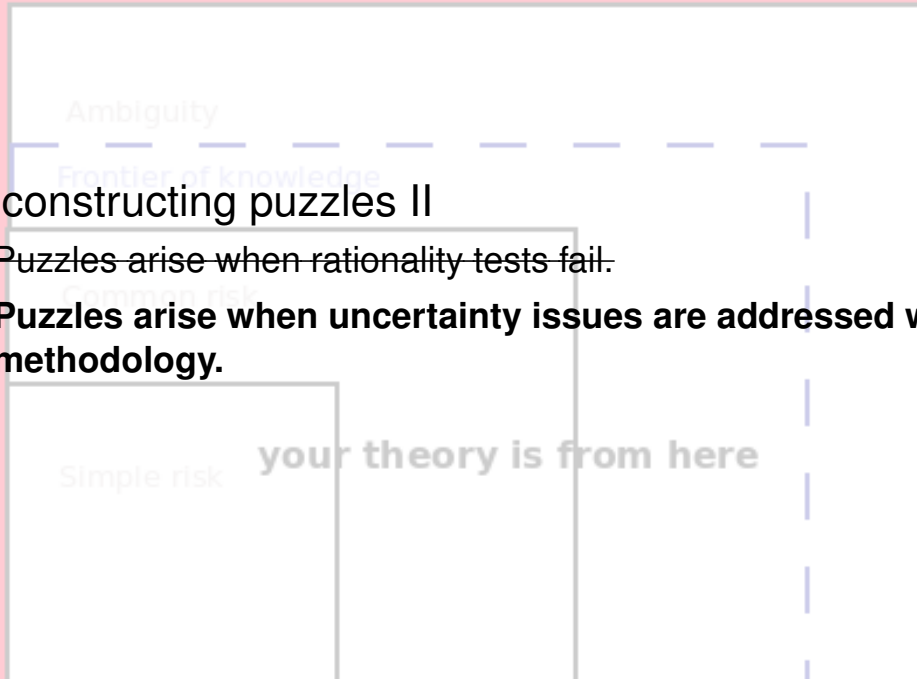

#### (De) constructing puzzles II

# Uncertainty and puzzles

## Puzzles

your data is from here

### (De) constructing puzzles II

- ▶ Puzzles arise when rationality tests fail.
- ▶ **Puzzles arise when uncertainty issues are addressed with risk methodology.**

# Uncertainty and puzzles

## Irrationality

But people do behave irrational!

- ▶ irrational exuberance
- ▶ anchor effect
- ▶ status quo bias
- ▶ endowment effect
- ▶ etc.

# Uncertainty and puzzles

## Irrationality

But people do behave irrational!

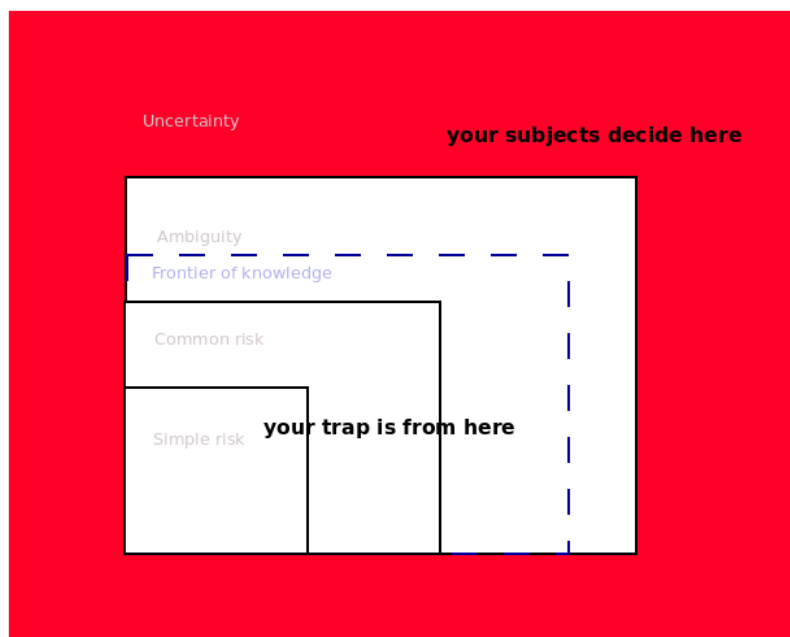

*when I see experimental evidence such as that underlying the Allais paradox, I find it very unproductive to marvel at the stupidity or irrationality of the human mind (this reaction may be attributed to the fact that I almost invariably fall into **the traps built by the experimenters!**).*

*Tirole, 2002, p. 640, emphasis added*

# Uncertainty and puzzles

## Irrationality

But people do behave irrational!

## Uncertainty and puzzles

### Puzzles and irrationality

#### Empirical uncertainty decision rules

- ▶ emotions (Damasio, 1995; 2012)
- ▶ anchor values (Kahneman, Schkade and Sunstein, 1998)
- ▶ endowment (Tversky and Griffin, 1991)
- ▶ institutions
- ▶ belief / religions
- ▶ credible information (Druckman, 2001)
- ▶ status quo (Samuelson and Zeckhauser, 1988)
- ▶ heuristics (Goldstein and Gigerenzer, 2002)
- ▶ inattention (Bacchetta and van Wincoop, 2005)
- ▶ deliberate ignorance / pretence of knowledge / DSGE
- ▶ science
- ▶ whim (Keynes, 1936, pp. 162â163)
- ▶ sentiment (Keynes, 1936, pp. 162â163)
- ▶ prejudice

## Uncertainty and puzzles

### Puzzles and irrationality

#### Insights

- 1. Puzzles arise when uncertainty issues are addressed with risk methodology.**
- 2. Irrationality arises when uncertainty methodology address risk problems.**

Simple risk

## Uncertainty and puzzles

### Puzzles and irrationality

#### Insights

1. **Puzzles arise when uncertainty issues are addressed with risk methodology.**
2. **Irrationality arises when uncertainty methodology address risk problems.**

**The research challenge is to match ontology and methodology.**

## Outlook

### Uncertainty and Economics

- ▶ role of institutions: taming uncertainty
- ▶ fiscal stimulus: potentially self-defeating
- ▶ money + inflation: trust determines price stability
- ▶ finance: “proof” of uncertainty

## Summary

### Uncertainty and Economics

- ▶ uncertainty is a human trait
- ▶ uncertainty is due to individualism
- ▶ uncertainty implies incomplete knowledge
- ▶ rationality is not testable under uncertainty
- ▶ research to focus on matching economic ontology and method
- ▶ research into efficient decision rules under uncertainty needed
- ▶ uncertainty commands re-interpretation of standard concepts
